155 MHz LASER SWITCH

Rev F2, Page 2/10

DESCRIPTION

Laser Switch iC-HK/B enables the spike-free switching of laser diodes with well-defined current pulses at frequencies ranging from DC to 155 MHz.

The diode current is determined by the voltage at pin CI and by the resistors RK1 and RK2. The two fast switches are controlled independently via CMOS inputs EN1 and EN2. The laser diode can thus be

turned on and off or switched between different current levels defined by the ratio of RK1 and RK2.

Each channel can be operated at 150 mA DC and up to 700 mA pulsed current depending on the frequency, duty cycle and heat dissipation.

The integrated thermal shutdown feature prevents damage from excessive temperature.

DESCRIPTION OF FUNCTIONS

Laser current dependency of V(CI), RK1, RK2

Depending on the laser diode different diode currents are necessary to obtain the required laser power. The values for V(CI), RK1 and RK2 can be determined for the required diode current at room temperature from the opposite diagram. A parallel to the x axis must be drawn through the desired diode current. Either RKx can be obtained for a required value of V(CI) or the respective value of V(VI) can be achieved for a given RKx.

Thermal Shutdown

iC-HK/B is protected by an integrated thermal shutdown feature. When the shutdown temperature is reached both channels are unconditionally switched off.
